# **GREEK SOVEREIGN DEBT CRISIS**

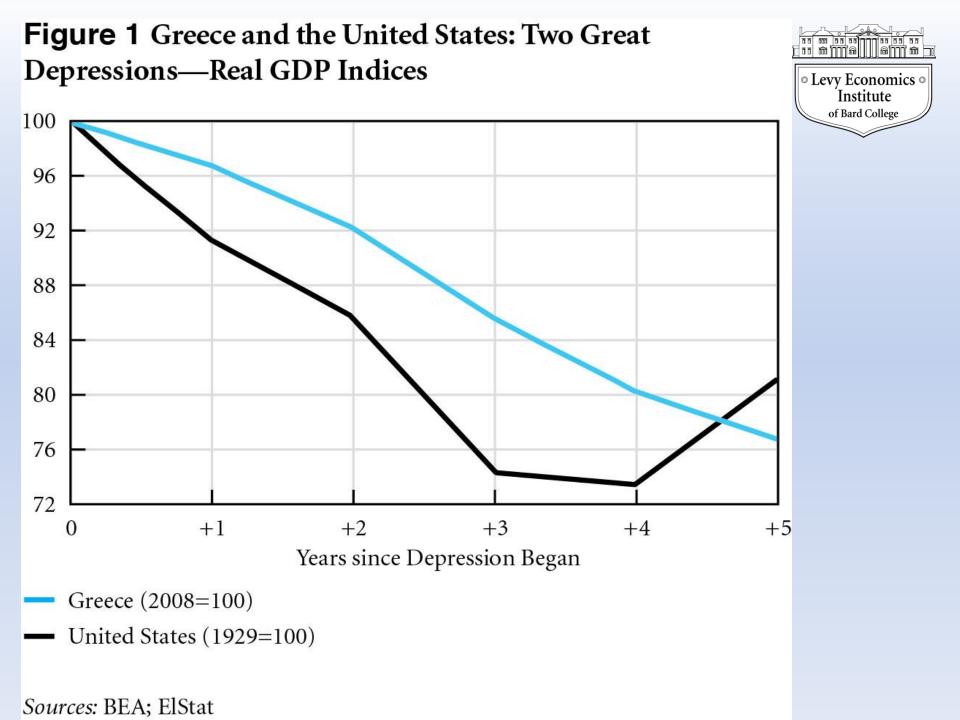

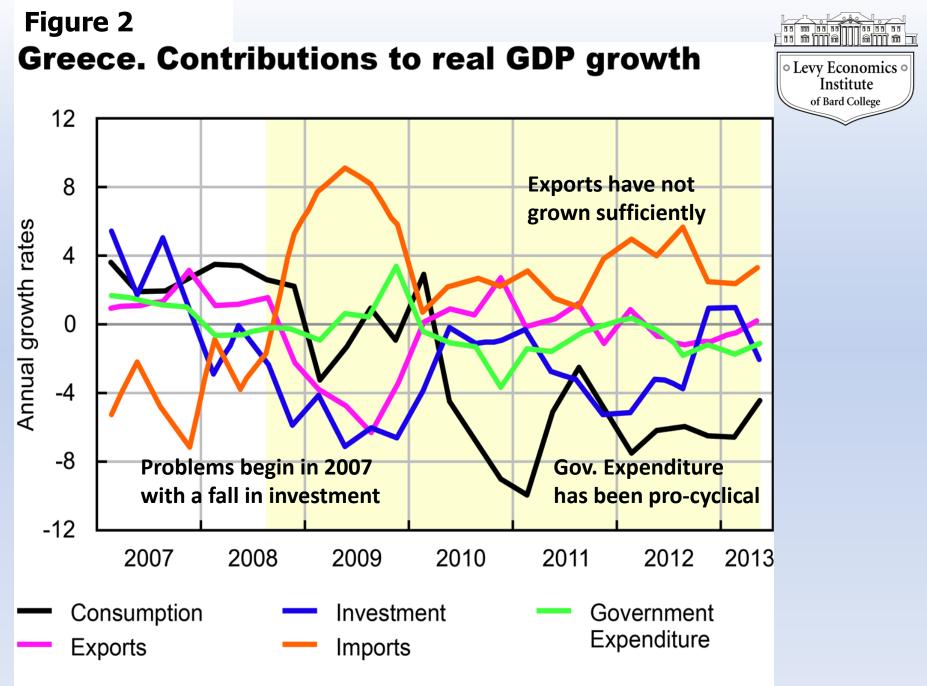

Inability of Greece to roll over maturing debt in 2009 because of much higher government deficits (15.8%) and accumulated debt of over 125% to GDP than originally estimated.

Fear of contagion involving other Eurozone countries, i.e., Portugal, Spain and even Italy.

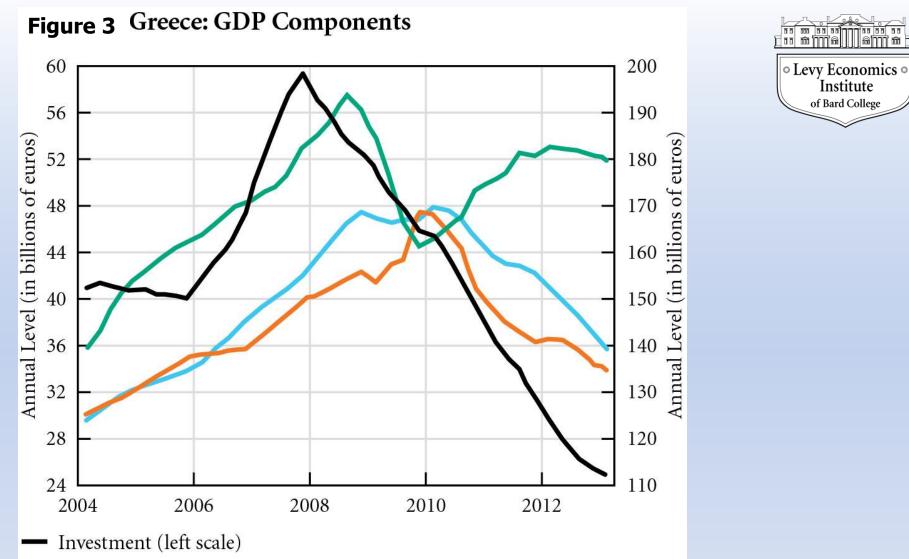

Greece turned to EU and IMF. The result was two rescue programs totaling about 240 billion euros with harsh austerity measures that are still continuing and causing devastating effects.

Greece is, for the sixth year, in continuing deep recession, and the cumulative economic effects are much worse than those experienced by the U.S. during the Great Depression.

# THE TROIKA PLAN

The Troika (IMF; EU; ECB) plan aimed at solving the problems trough

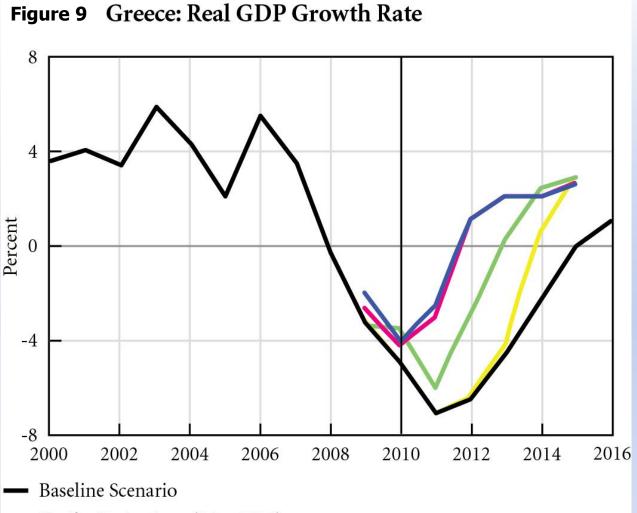

- Fiscal austerity: reducing public employment; increasing taxes; privatizing public enterprises
- Internal devaluation: target 15% decrease in nominal wages; actual devaluation is 30%, double the target
- Public debt has been restructured (haircut) and gradually transformed. Now most of Greek public debt is a credit of EFSF and other Eurozone institutions

# THE FAULTY STRUCTURE OF THE EURO PROJECT

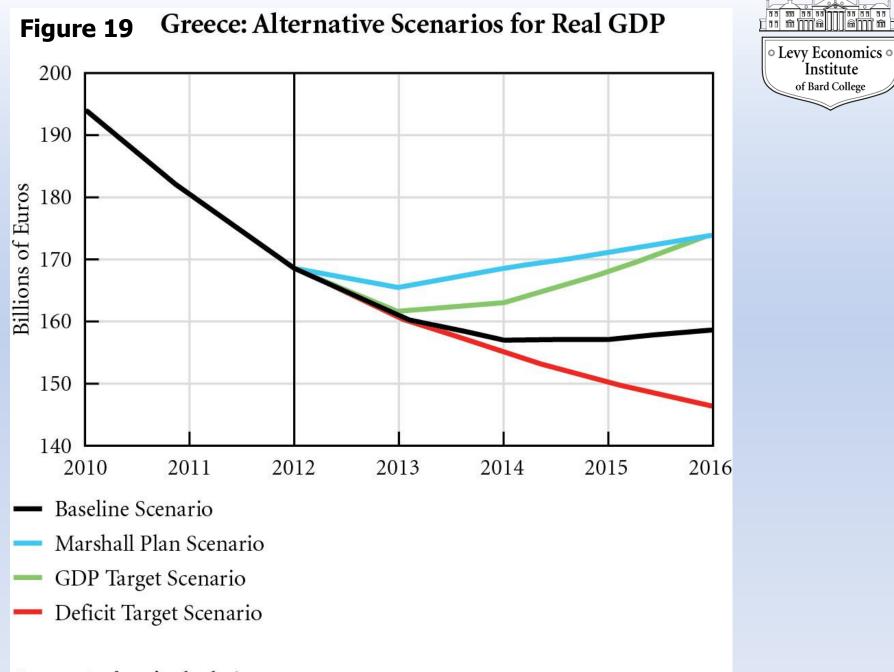

- If the European leaders had good knowledge of Eurozone countries' balance sheets, they would know that, for example, Germany's trade surpluses are matched with the south member countries' trade deficits.
- Member states with surpluses need to behave in a cooperative manner toward the trade deficit member states.
- An expansionary policy in Germany and other north European member states, together with increases in private sector wages, would help reduce Eurozone internal imbalances.
- Eurobonds, a Euro Treasury and/or a recycling of trade surpluses are the solutions to rehabilitate and complete the Euro project.
- But, since all of the above appear politically infeasible, other national options must be considered.

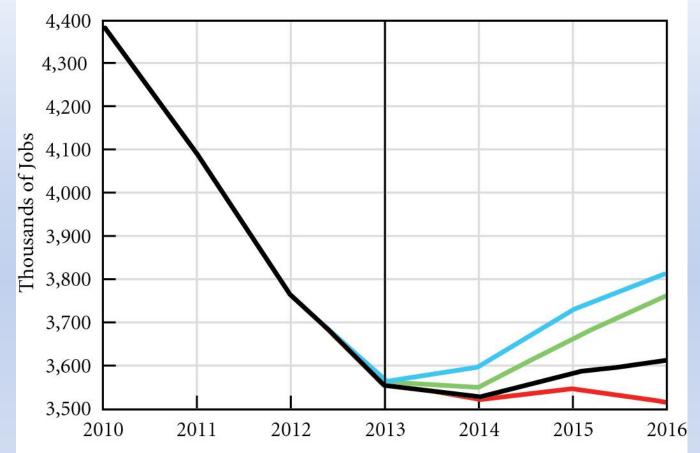

# AN ALTERNATE POLICY OPTION: A MARSHALL PLAN

- Externally funded and overseen by the European Investment Bank or other EU institution, for a total amount of 30 billion Euros at the rate of 2 billion each quarter beginning now.
- Funds would be spent for public consumption and targeted investment to foster growth in key production of goods and services.
- Funds could be used to finance a direct job creation program along the lines discussed.

# A SECOND ALTERNATIVE POLICY OPTION: SUSPENDING ALL INTEREST PAYMENTS AND FREEZING PUBLIC DEBT

- Public sector debt is frozen with no interest payments made until GDP levels are restored to 2010 levels.
- Creditors agree to roll over maturing debt for as many years, until 2010 GDP levels are restored.
- Interest payment is conservatively estimated at about 7.5 billion Euro per year.
- The amount of 7.5 billion Euro per year could be used, instead, for public consumption and targeted investments or to finance a direct job creation program.

# TIME TO THINK THE UNTHINKABLE: A PARALLEL CURRENCY

**Important Issues to Consider:** 

- Should it be convertible?
- Should it be backed by gold, reserves, future current account revenue, future tax revenue or nothing (fiat money)?
- How much parallel currency to inject?
- Which transactions should it be used for?
- Should existing financial assets be redenominated?
- Should foreign debt be redenominated?
- What would be the fiscal/monetary policy?
- Which institution would be the issuer of the parallel currency?

# A PARALLEL CURRENCY POLICY OPTION FEATURES:

- Responsibility for the parallel currency will rest with the independent Bank of Greece to avoid government exceeding the agreed upon limits
- Government perpetual Geuro bonds, transferable, denominated at zero interest, acceptable at par in lieu of tax payments to government employees, domestic suppliers and transfer payments recipients, controlled by the Central Bank
- One way convertibility, from Euro  $\rightarrow$  Geuro

## PARALLEL CURRENCY USAGE

- Conversion of government loans held by the financial sector in Geuro (about 15 billion Euro)
- 50 percent of social benefits paid in Geuro (about 19.3 billion Euro)
- 30 percent of public sector wages in Geuro (about 7.2 billion Euro)
- Conversion of government accounts payable (Tax refunds, etc.) in Geuro

# PARALLEL CURRENCY TO FINANCE A DIRECT JOB CREATION PROGRAM

- Research findings by the Levy Institute estimate the total cost for both direct job creation wages and indirect costs to be at approximately 7.1 billion Euros/year covering over 550,000 persons
- The multiplier of the program will create about 160,000 additional jobs and increase GDP by 11.6 billion Euros
- Tax revenues will also be increased by almost 4 billion
- The impact on imports should be smaller than in programs financed in Euro
- The program should be complemented with additional measures to increase productive capacity and provide some import substitution

# ESTIMATED IMPACT OF A PARALLEL CURRENCY POLICY OPTION

- If Euro "savings" are used to reduce the stock of debt, this policy option is somewhat contractionary
- If Greece continues paying interest on foreign debt at current rates, the growth path will be similar to our baseline scenario
- If the parallel currency option is in addition to the "debt freeze", the impact on the economy will be more substantial, and the consequences on the current account will be better
